

CHROMIX[®] Admixtures

for Color-Conditioned[®] Concrete

Contractor Sheet

Choose CHROMIX[®] Admixtures for Color-Conditioned[®] Concrete to produce colorful architectural concrete in vertical or horizontal construction projects. Integral coloring with CHROMIX Admixtures is suitable for colored concrete construction projects including floors, hardscapes, cast-in-place, or precast concrete. CHROMIX Admixtures is available in 24 standard powder colors.

Colors:

- Hundreds of liquid and granular color formulations are readily available, in addition to our custom color matching service.

Available in three convenient forms:

- CHROMIX P (powdered)
- CHROMIX L (liquid) in buckets and totes
- CHROMIX G (granular)

Keys to success:

- Request that the concrete all be batched and delivered from the same location.
- A consistent slump must be maintained for all placements.
- Avoid sprinkling water on the surface. Use a dry broom.
- Maintain uniform texturing of the surface.
- Use only recommended curing and sealing materials.
- Always produce job site samples – especially for interiors.
- If using fly-ash, a mockup MUST be placed to verify color.

For superior color development and reliable results, use LITHOCHROME[®] Colorwax™ and COLORCURE[®] Concrete Sealer to provide optimum results and allow concrete surfaces to reach their full color potential and beauty. When a clear curing and sealing material is desired for indoor or outdoor use, use SCOFIELD[®] Cureseal-S™.

Working tip:

Efflorescence can mask surface color. Use LITHOCHROME Colorwax to reduce the likelihood of efflorescence formation.

Prior to beginning the job, consult the appropriate Scofield Tech-Data Bulletin for CHROMIX Admixtures P, L, or G.
